

WHO IT SERVES

**BUILT FOR CONTRACTORS.
TRUSTED BY ENGINEERS
AND MUNICIPALITIES**

FOR CONTRACTORS

- Complete jobs faster with installations completed in as little as 2 hours.
- Minimize crew and equipment requirements on site.
- Avoid excavation and reduce disruption to surrounding work areas.
- Keep projects moving with a fast, practical rehabilitation process.

FOR ENGINEERS & MUNICIPALITIES

- Achieve a fully sealed manhole rehabilitation solution.
- Stop infiltration at the source before lining begins.
- Adapt to existing manhole geometry without time-consuming prefabrication.
- Extend service life with an expected lifespan of up to 50 years.

MANHOLE REHABILITATION

**LESS TIME.
LESS DISRUPTION.**

**ENGINEERED FOR PERFORMANCE.
TRUSTED ON ACTIVE
INFRASTRUCTURE PROJECTS.**

PROCESS

HOW IT WORKS

01

STOP THE LEAK

Water-reactive chemical grout is injected to expand on the outside of the manhole and stop infiltration before lining.

02

INSTALL THE LINER

The expandable liner adapts to the geometry of the manhole automatically, reducing the need for prefabrication.

03

UV CURE

Efficient UV curing technology creates a durable liner with a small site footprint and minimal disruption.

04

SEAL & FINISH

Once trimmed, open seams are sealed with a fully waterproof sealant for a complete rehabilitation result.

OUTCOME

THE END RESULT

A fully sealed, relined manhole with long-term durability, less disruption, and lower cost than traditional replacement approaches.

WHY CORE SHIELD

A SMARTER APPROACH TO MANHOLE REHABILITATION

Core Shield's UV-cure lining system is designed for active infrastructure environments where speed, durability, and reduced disruption matter.

- No excavation required.
- Small jobsite footprint.
- One-step lining for wall, benching and channel.
- Reduced disruption to traffic and surrounding infrastructure.
- Cost-effective alternative to traditional dig-and-replace methods
